

The Universal Gas Tapping device.

This small thingy lets you connect any two standard inflator hoses together to create a low pressure manifold. Provided the IP of both first stages is equal.
It are two inflator nipples connected in opposition to each other.
The nipples can be found in any dive shop. The connection was found in my local do it yourself shop.

This manifold was tested to -40m. But became hard to breathe from -30m. It might be an aid in some situations but needs to be practised and tested prior to use.
